#### **QUARKS** - 2014

18th International Seminar on High Energy Physics 2 - 8 June, 2014, Suzdal, Russia

- Dark Energy or Modifed Gravity ?
- Curvature Oscillations in F(R) Theories in Systems with Rising Energy Density
- Spherically Symmetric Solutions in F(R) Gravity and Gravitational Repulsion
- Conclusions

# **Cosmological Acceleration**

The data in favor of accelerated expansion:

- observation of the large scale structure of the universe
- measurements of the angular fluctuations of the CMBR
- determination of the universe age
- discovery of the dimming of distant Supernovae

With cosmological inflation, at the very beginning, the picture would be:

- first acceleration (initial push)
- then normal deceleration
- and lastly (today) surprising acceleration again

# **Cosmological Equations**

Universe expansion is described by scale factor  $\mathbf{a}(\mathbf{t})$ , which satisfies the Friedmann equations. In particular, cosmological acceleration is given by:

$$\frac{\ddot{a}}{a} = -\frac{4\pi \, \mathsf{G}_{\mathsf{N}}}{3} \left( \varrho + 3\mathsf{P} \right)$$

- **NB**: Pressure gravitates!
  - Source of gravitational force  $\rho + 3P$ , not only  $\rho$ .
  - Negative pressure is a source of the cosmological expansion, cosmic antigravity.

### Equation of State

- There are two independent cosmological equations for three functions  $\mathbf{a}(\mathbf{t})$ ,  $\boldsymbol{\varrho}(\mathbf{t})$ ,  $\mathbf{P}(\mathbf{t})$ .
- These equations should be supplemented by the equation of state  $\mathbf{P} = \mathbf{P}(\varrho)$ , which is determined by physical properties of matter.

Usually matter is described by linear equation of state:

#### $\mathbf{P} = \mathbf{w}\varrho$

- Non-relativistic matter:  $\boldsymbol{w}_{nr}=\boldsymbol{0}$
- Relativistic matter:  $w_{\text{rel}}=1/3$
- Dark energy:  $w_{DE} = -1.13^{+0.13}_{-0.10}$

### Possible source of the cosmic acceleration?

#### Dark Energy: $P < -\varrho/3$

- small vacuum energy, which is identical to cosmological constant
- energy density associated with an unknown, presumably scalar field, which slowly varies in the course of the cosmological evolution

#### Modification of Gravity, which is considered below.

# Gravity Modification

Action in  $f(\mathbf{R})$  theories:

$$\begin{split} \textbf{S} &= \; \frac{m_{\text{Pl}}^2}{16\pi} \int d^4 x \sqrt{-g} \textbf{f}(\textbf{R}) + \textbf{S}_m \\ &= \; \frac{m_{\text{Pl}}^2}{16\pi} \int d^4 x \sqrt{-g} [\textbf{R} + \textbf{F}(\textbf{R})] + \textbf{S}_m \end{split}$$

Here  $m_{Pl} = 1.22 \cdot 10^{19} \text{GeV}$  is the Planck mass and  $S_m$  is the matter action.

- Usual Einstein gravity: f(R) = R
- Modified gravity: f(R) = R + F(R)

# **Pioneering Works**

#### The pioneering suggestion:

- S.M. Carroll, V. Duvvuri, M. Trodden, M.S. Turner, Phys. Rev. D70 (2004) 043528, astro-ph/0306438.

$$\mathsf{F}(\mathsf{R}) = -\mu^4/\mathsf{R}$$

 $\mu^2 \sim R_c \sim 1/t_u^2$  is a small parameter with dimension of mass squared.

- Agreement with Newtonian limit for sufficiently small  $\mu$ .
- Strong instability in presence of matter

Can modified gravity explain accelerated cosmic expansion? A.D. Dolgov, M. Kawasaki, Phys.Lett. B573 (2003) 1.

#### Modified modified gravity: free from exponential instability

W.Hu, I. Sawicki, Phys. Rev. D 76, 064004 (2007).

$$F_{\rm HS}(R) = -\frac{R_{vac}}{2} \frac{c \left(\frac{R}{R_{vac}}\right)^{2n}}{1+c \left(\frac{R}{R_{vac}}\right)^{2n}}, \label{eq:FHS}$$

A.Appleby, R. Battye, Phys. Lett. B 654, 7 (2007).

$$\mathsf{F}_{\mathrm{AB}}(\mathsf{R}) = \frac{\epsilon}{2} \log \left[ \frac{\cosh\left(\frac{\mathsf{R}}{\epsilon} - \mathsf{b}\right)}{\cosh \mathsf{b}} \right] - \frac{\mathsf{R}}{2} \,,$$

A.A. Starobinsky, JETP Lett. 86, 157 (2007).

$$\mathbf{F}_{\mathrm{S}}(\mathbf{R}) = \lambda \mathbf{R}_{0} \left[ \left( 1 + \frac{\mathbf{R}^{2}}{\mathbf{R}_{0}^{2}} \right)^{-n} - 1 \right]$$

E. Arbuzova, A. Dolgov ()

### Curvature Oscillations in Modified Gravity

 E. V. Arbuzova, A. D. Dolgov, L. Reverberi, Curvature Oscillations in Modified Gravity and High Energy Cosmic Rays, Eur.Phys.J.C(2012) 72:2247, arXiv:1211.5011; Particle Production in f(R) Gravity during Structure Formation, Phys.Rev.D 88, 024035 (2013), arXiv:1305.5668.
Starobinsky model with R<sup>2</sup> term:

$$\mathbf{F}(\mathbf{R}) = -\lambda \mathbf{R}_0 \left[ 1 - \left( 1 + \frac{\mathbf{R}^2}{\mathbf{R}_0^2} \right)^{-n} \right] - \frac{\mathbf{R}^2}{\mathbf{6}\mathbf{m}^2}$$

- $\bullet$  Parameter m is bounded by  $m\gtrsim 10^5~\mbox{GeV}$  to preserve successful predictions of BBN.
- **R**<sup>2</sup>-term is included to prevent curvature singularities in the presence of contracting bodies.
- E.V. Arbuzova, A.D. Dolgov, Explosive phenomena in modified gravity. Phys.Lett.B700(2011)289: R<sup>2</sup> prevents from hitting infinity but still the maximum amplitude of R reaches a large value much larger than in GR

E. Arbuzova, A. Dolgov ()

**Cosmic Antigravity** 

June 7 10 / 27

#### **Basic Equations**

The evolution of  $\mathbf{R}$  is determined from the equation:

$$3\mathcal{D}^{2}\mathsf{F}_{\mathsf{R}}^{\prime}-\mathsf{R}+\mathsf{R}\mathsf{F}_{\mathsf{R}}^{\prime}-2\mathsf{F}=\mathsf{T}$$

•  $\mathcal{D}^2$  is the covariant D'Alambertian operator,  $F'_R \equiv dF/dR$ •  $T \equiv 8\pi T^{\mu}_{\mu}/m^2_{Pl}$  and  $T_{\mu\nu}$  is energy-momentum tensor of matter. We are interested in the regime  $|\mathbf{R}_0| \ll |\mathbf{R}| \ll m^2$ , in which:

$$\mathsf{F}(\mathsf{R})\simeq -\lambda\mathsf{R}_0\left[1-\left(\frac{\mathsf{R}_0}{\mathsf{R}}\right)^{2\mathsf{n}}\right]-\frac{\mathsf{R}^2}{\mathsf{6}\mathsf{m}^2}\,.$$

We study the evolution of R in a contracting astrophysical system with rising energy density:

$$arrho = arrho_0 (1 + t/t_{contr})$$

We assume that the gravity of matter is not strong and thus the background metric is flat:  $3\partial_t^2 F'_R - R - T = 0$ .

#### New Notations: Oscillator Equation

With the dimensionless quantities:

$$\begin{split} \mathbf{z} &\equiv \frac{\mathsf{T}(\mathsf{t})}{\mathsf{T}(\mathsf{t}_{\mathsf{in}})} \equiv \frac{\mathsf{T}}{\mathsf{T}_0} = \frac{\varrho_\mathsf{m}(\mathsf{t})}{\varrho_{\mathsf{m}0}}, \quad \mathsf{y} \equiv -\frac{\mathsf{R}}{\mathsf{T}_0}, \\ \mathbf{g} &= \frac{1}{6\lambda\mathsf{n}(\mathsf{mt}_\mathsf{U})^2} \left(\frac{\varrho_\mathsf{m}0}{\varrho_\mathsf{c}}\right)^{2\mathsf{n}+2}, \quad \tau \equiv \mathsf{m}\sqrt{\mathsf{g}}\,\mathsf{t} \end{split}$$

and new function, proportional to F'(R):

$$\xi \equiv \frac{1}{2\lambda n} \left(\frac{\mathsf{T}_0}{\mathsf{R}_0}\right)^{2n+1} \mathsf{F}_{\mathsf{R}}' = \frac{1}{\mathsf{y}^{2n+1}} - \mathsf{g}\mathsf{y}$$

The equation of motion for  $\xi$  takes the simple oscillator form:

$$\xi'' + \mathrm{d} \mathsf{U}/\mathrm{d} \xi = \mathbf{0}\,, \;\; ext{where} \;\;\; \mathrm{d} \mathsf{U}/\mathrm{d} \xi = \mathsf{z} - \mathsf{y}(\xi).$$

**y** cannot be expressed through  $\boldsymbol{\xi}$  analytically so we have to use different approximate expressions in different ranges of  $\boldsymbol{\xi}$ .

E. Arbuzova, A. Dolgov ()

**Cosmic Antigravity** 

# Potential: $U(\xi) = U_+(\xi)\Theta(\xi) + U_-(\xi)\Theta(-\xi)$

• Left panel (n = 2, z = 1.5): solid line: g = 0.02, dashed line: g = 0.01, dotted line: g = 0.002. Right panel (n = 2, g = 0.01): solid line: z = 1.3, dashed line: z = 1.4, dotted line: z = 1.5.

$$\begin{split} & \mathsf{U}_+(\xi) = \mathsf{z}\xi - \frac{2\mathsf{n}+1}{2\mathsf{n}} \left[ \left(\xi + \mathsf{g}^{(2\mathsf{n}+1)/(2\mathsf{n}+2)}\right)^{2\mathsf{n}/(2\mathsf{n}+1)} - \mathsf{g}^{2\mathsf{n}/(2\mathsf{n}+2)} \right] \,, \\ & \mathsf{U}_-(\xi) = \left(\mathsf{z} - \mathsf{g}^{-1/(2\mathsf{n}+2)}\right) \xi + \frac{\xi^2}{2\mathsf{g}} \,. \end{split}$$

E. Arbuzova, A. Dolgov ()

#### Oscillations of Curvature. "Spike-like" Solutions

In contrast to  $\xi$  the oscillations of **y** are strongly unharmonic. For negative and even very small  $|\xi|$  the amplitude of **y** may be very large because  $\mathbf{y} \approx -\xi/\mathbf{g}$ , according to  $\xi = 1/\mathbf{y}^{2n+1} - \mathbf{g}\mathbf{y}$ .

"Spikes" in the solutions. n = 2, g = 0.001, and  $y'_0 = 0.2$ .

If the energy density rises with time, fast oscillations of the scalar curvature are induced, with an amplitude possibly much larger than usual GR value  $\mathbf{R} = -\tilde{\mathbf{T}}$ .

Cosmic Antigravity

For negative  $\xi$  potential behaves as  $\mathbf{U} \approx \xi^2/(2\mathbf{g})$ , so the characteristic frequency of oscillations in the spike region:

 $\Omega \sim 1/\sqrt{\mathrm{g}}$  in dimensionless time or  $\omega \approx \mathrm{m}$  in physical time.

Evidently frequency of oscillations of  ${\boldsymbol{y}}$  in this region is the same.

NB

• The presented values correspond to maximum value of the frequency. Anyhow,  $\omega \leq \mathbf{m}$ .

#### Spike-like Solutions

Solution of modified gravity equations for finite-size astronomical objects with rising energy density:

$$\mathbf{R} = \mathbf{R}_{GR}(\mathbf{r})\mathbf{y}(\mathbf{t}), \quad \mathbf{R}_{GR} = -\tilde{\mathbf{T}}(\mathbf{r}) = -\frac{8\pi T^{\mu}_{\mu}(\mathbf{r})}{m^2_{Pl}}$$

The maximum value of **y** in the spike region is:

$$\mathbf{y}_{\text{max}}(t) \sim 6n(2n+1)mt_{u}\left(\frac{t_{u}}{t_{\text{contr}}}\right) \left[\frac{\varrho_{m}(t)}{\varrho_{m0}}\right]^{(n+1)/2} \left(\frac{\varrho_{c}}{\varrho_{m0}}\right)^{2n+2}$$

The energy density of the contracting cloud behaves as

$$arrho_{m}(t) = arrho_{m0}(1+t/t_{contr})$$

- $\bullet$  The mass  $m\geq 10^5~\text{GeV}$  to avoid a conflict with BBN.
- $\bullet~mt_u \geq 10^{47}$  and y can reach a very high value

## Spike Region

Spikes of high amplitude are formed if:

$$6n^2(2n+1)^2 \left(\frac{t_u}{t_{contr}}\right)^2 \left[\frac{\varrho_m(t)}{\varrho_{m0}}\right]^{3n+1} \left(\frac{\varrho_c}{\varrho_{m0}}\right)^{2n+2} > 1$$

- Formation of galaxies or their clusters:  $\rho_{m0}/\rho_c = 1 10^3$  and  $\rho_m(t)/\rho_{m0}$  varying in the range  $1 10^5$ .
- Formation of stellar or planetary type objects from the intergalactic gas with the initial density  $10^{-24}~{\rm g/cm^3}$ :  $\varrho_{m0}/\varrho_c=10^5$  and  $\varrho_m(t)/\varrho_{m0}$  can vary in the range  $1-10^{24}$  or more.

The oscillations of curvature in such systems are excited if their mass density started to rise with time.

# Spherically Symmetric Solutions in F(R) Gravity

Assumption: the background space-time is nearly flat and so the background metric is almost Minkowsky.

Is this approximation valid for large deviation of curvature from its GR value?

 E.V. Arbuzova, A.D. Dolgov, L. Reverberi, Spherically Symmetric Solutions in F(R) Gravity and Gravitational Repulsion. Astropart.Phys.54(2014)44-47.

We consider a spherically symmetric bubble of matter of radius  ${\bf r}_{\rm m},$  and study spherically symmetric solution of modified EoM

$$\begin{split} \left(1+\mathsf{F}_{\mathsf{R}}'\right)\mathsf{R}_{\mu\nu} &-\frac{1}{2}\left(\mathsf{R}+\mathsf{F}\right)\mathsf{g}_{\mu\nu} + \left(\mathsf{g}_{\mu\nu}\mathsf{D}_{\alpha}\mathsf{D}^{\alpha}-\mathsf{D}_{\mu}\mathsf{D}_{\nu}\right)\mathsf{F}_{\mathsf{R}}' = \tilde{\mathsf{T}}_{\mu\nu} \\ & 3\mathsf{D}^{2}\mathsf{F}_{\mathsf{R}}'-\mathsf{R}+\mathsf{R}\mathsf{F}_{\mathsf{R}}'-2\mathsf{F}=\tilde{\mathsf{T}} \end{split}$$

We use the Schwarzschild metric and assume that the metric is close to the flat one:

$$ds^{2} = A(r,t)dt^{2} - B(r,t)dr^{2} - r^{2}(d\theta^{2} + \sin^{2}\theta \, d\phi^{2})$$

$$\mathsf{A}_1=\mathsf{A}-1\ll 1 \ \mathrm{and} \ \mathsf{B}_1=\mathsf{B}-1\ll 1$$

# Equations of Motion

It is convenient to use EoM in the following form:

$$\begin{split} \mathsf{R}_{00} - \mathsf{R}/2 &= \frac{\tilde{\mathsf{T}}_{00} + \Delta \mathsf{F}_{\mathsf{R}}' + \mathsf{F}/2 - \mathsf{R}\mathsf{F}_{\mathsf{R}}'/2}{1 + \mathsf{F}_{\mathsf{R}}'} \\ \mathsf{R}_{\mathsf{rr}} + \mathsf{R}/2 &= \frac{\tilde{\mathsf{T}}_{\mathsf{rr}} + (\partial_{\mathsf{t}}^2 + \partial_{\mathsf{r}}^2 - \Delta)\mathsf{F}_{\mathsf{R}}' - \mathsf{F}/2 + \mathsf{R}\mathsf{F}_{\mathsf{R}}'/2}{1 + \mathsf{F}_{\mathsf{R}}'} \end{split}$$

In the weak field limit:

$$\begin{array}{ll} \mathsf{R}_{00} &\approx& \displaystyle \frac{\mathsf{A}''-\ddot{\mathsf{B}}}{2}+\frac{\mathsf{A}'}{\mathsf{r}}, & \mathsf{R}_{\mathsf{rr}} \approx \displaystyle \frac{\ddot{\mathsf{B}}-\mathsf{A}''}{2}+\frac{\mathsf{B}'}{\mathsf{r}} \\ \mathsf{R} &\approx& \mathsf{A}''-\ddot{\mathsf{B}}+\frac{2\mathsf{A}'}{\mathsf{r}}-\frac{2\mathsf{B}'}{\mathsf{r}}+\frac{2(1-\mathsf{B})}{\mathsf{r}^2} \end{array}$$

If the energy density of matter inside the the cloud, i.e. for  $r < r_m,$  is much larger than the cosmological energy density, then:

$$\mathsf{F}_{\mathsf{R}}^{\prime} \ll 1 \hspace{0.2cm} \mathrm{and} \hspace{0.2cm} \mathsf{F} \ll \mathsf{R}$$

**Cosmic Antigravity** 

#### **General Solutions**

We assume that spatial derivatives of  ${\bf F}_{\rm R}^\prime$  are small and we find:

$$\begin{split} B_1' + \frac{B_1}{r} &= r\tilde{T}_{00} \\ A_1'' - \frac{A_1'}{r} &= -\frac{3B_1}{r^2} + \ddot{B}_1 + \tilde{T}_{00} - 2\tilde{T}_{rr} + \frac{\tilde{T}_{\theta\theta}}{r^2} + \frac{\tilde{T}_{\varphi\varphi}}{r^2\sin^2\theta} \equiv S_A \end{split}$$

Equation for  $B_1$  has the solution:

$$B_1(r,t) = \frac{C_B(t)}{r} + \frac{1}{r} \, \int_0^r dr' r'^2 \tilde{T}_{00}(r',t) \label{eq:B1}$$

To avoid a singularity at r=0 we have to assume that  $C_B(t)\equiv 0.$ 

$$A_1(r,t) = C_{1A}(t)r^2 + C_{2A}(t) + \int_{r}^{r_m} dr_1 r_1 \int_{r_1}^{r_m} \frac{dr_2}{r_2} S_A(r_2,t)$$

E. Arbuzova, A. Dolgov ()

# The Schwarzschild Limit

The mass of matter inside a radius  $\mathbf{r}$  is defined in the usual way:

$$\mathsf{M}(\mathsf{r},\mathsf{t}) = \int_0^\mathsf{r} \mathsf{d}^3\mathsf{r}\,\mathsf{T}_{00}(\mathsf{r},\mathsf{t}) = 4\pi\int_0^\mathsf{r} \mathsf{d}\mathsf{r}\,\mathsf{r}^2\,\mathsf{T}_{00}(\mathsf{r},\mathsf{t})$$

If all matter is confined inside a radius  $r_m$ , the total mass is  $M\equiv M(r_m)$  and it does not depend on time.

Since 
$$ilde{\mathsf{T}}_{00}=8\pi\mathsf{T}_{00}/\mathsf{m}_{\mathsf{Pl}}^2$$
, we obtain for  $\mathsf{r}>\mathsf{r}_\mathsf{m}$ :

$$\mathsf{B}_1=\mathsf{r_g}/\mathsf{r}$$
, where  $\mathsf{r_g}=2\mathsf{M}/\mathsf{m}_\mathsf{Pl}^2$ 

The metric coefficient  $A_1$  outside the source is:

$$\mathsf{A}_1 = -\frac{\mathsf{r}_g}{\mathsf{r}} + \left[\mathsf{C}_{1\mathsf{A}}(\mathsf{t}) - \frac{\mathsf{r}_g}{2\mathsf{r}_m^3}\right]\mathsf{r}^2 + \left[\mathsf{C}_{2\mathsf{A}}(\mathsf{t}) + \frac{3\mathsf{r}_g}{2\mathsf{r}_m}\right]$$

### Modified Gravity Solutions

The coefficient  $C_{1A}(t)$  can be found from equation for R:

$$R \approx A'' + \frac{2A'}{r} - \ddot{B} - \frac{2B'}{r} + \frac{2(1-B)}{r^2}$$

• In systems with rising energy density the curvature scalar may be much larger than its value in GR.

Using eqs. for  $A_1$  and  $B_1$  and comparing them to expression for R, we get:  $C_{1A}(t)=R(t)/6$ 

$$\mathsf{R}_{\mathsf{max}}(t) \sim - \mathsf{6n}(2\mathsf{n}+1)\mathsf{mt}_{\mathsf{u}}\left(\frac{\mathsf{t}_{\mathsf{u}}}{\mathsf{t}_{\mathsf{contr}}}\right) \left[\frac{\varrho_{\mathsf{m}}(t)}{\varrho_{\mathsf{m}0}}\right]^{(\mathsf{n}+1)/2} \left(\frac{\varrho_{\mathsf{c}}}{\varrho_{\mathsf{m}0}}\right)^{2\mathsf{n}+2} \tilde{\mathsf{T}}$$

The difference between modified and standard solutions in vacuum:

- In the standard case the term proportional to  $r^2$  appears both at  $r < r_m$  and  $r > r_m$  with the same coefficient and we have to choose the arbitrary constant so that this term vanishes.
- For modified gravity such condition is not applicable and the  $C_{1A}r^2$ -term may be present at  $r < r_m$  and absent at  $r \gg r_m$ .

E. Arbuzova, A. Dolgov ()

**Cosmic Antigravity** 

#### Metric Functions inside a Cloud

The metric functions inside the cloud are equal to:

$$\begin{array}{lll} \mathsf{B}(\mathsf{r},\mathsf{t}) &=& 1+\frac{2\mathsf{M}(\mathsf{r},\mathsf{t})}{\mathsf{m}_{\mathsf{Pl}}^2\mathsf{r}} \equiv 1+\mathsf{B}_1^{(\mathsf{Sch})} \\ \mathsf{A}(\mathsf{r},\mathsf{t}) &=& 1+\frac{\mathsf{R}(\mathsf{t})\,\mathsf{r}^2}{6}+\mathsf{A}_1^{(\mathsf{Sch})}(\mathsf{r},\mathsf{t}) \end{array}$$

For the Schwarzschild part of the solution we find:

$$A_1^{(Sch)}(r,t) = \frac{r_g r^2}{2r_m^3} - \frac{3r_g}{2r_m} + \frac{\pi \ddot{\varrho}_m}{3m_{\text{Pl}}^2} (r_m^2 - r^2)^2$$

The oscillating part  $R(t)r^2/6$  gives the dominant contribution into  $A_1$ :

- $r^2 R(t) \sim r^2 y(t) \, R_{GR}$  with y>1 ,  $|R_{GR}| = 8 \pi \varrho_m/m_{Pl}^2$
- $\bullet$  the canonical Schwarzschild terms:  $r_g/r_m\sim \varrho_m r_m^2/m_{Pl}^2\sim r_m^2 R_{GR}.$

## Applicability of the Approximation

- Assumption: the background metric weakly deviates from the flat Minkowsky one.
- Though it is certainly true for the Schwarzschild part of solution, this may be questioned for the  $r^2 R(t)/6$  term.

The flat background metric is not noticeably distorted if

 $r^2 < 6/R(t)$ 

If the initial energy density of the cloud is of the order of the cosmological energy density

 $R_{GR} \sim 1/t_u^2,$ 

the metric would deviate from the Minkowsky one for clouds with:

 $r_m > t_u/\sqrt{y}$ .

At the stage of the rising R(t), when y > 1 but not huge, the flat space approximation would be valid over all the volume of the collapsing cloud.

E. Arbuzova, A. Dolgov ()

**Cosmic Antigravity** 

June 7 24 / 27

### Anti-gravity inside a Cloud

In the lowest order in the gravitational interaction the motion of a non-relativistic test particle is governed by the equation:

$$\ddot{\mathsf{r}} = -\frac{\mathsf{A}'}{2} = -\frac{1}{2}\left[\frac{\mathsf{R}(\mathsf{t})\mathsf{r}}{3} + \frac{\mathsf{r}_{\mathsf{g}}\mathsf{r}}{\mathsf{r}_{\mathsf{m}}^3}\right]$$

• Since **R**(**t**) is always negative and large, the modifications of GR considered here lead to anti-gravity inside a cloud with energy density exceeding the cosmological one.

Gravitational repulsion dominates over the usual attraction if:

$$\frac{|\mathsf{R}|\mathsf{r}_m^3}{3\mathsf{r}_{g}} = \frac{|\mathsf{R}|\mathsf{r}_m^3\mathsf{m}_{\mathsf{Pl}}^2}{6\mathsf{M}} = \frac{|\mathsf{R}|\mathsf{r}_m^3\mathsf{m}_{\mathsf{Pl}}^2}{8\pi\varrho\,\mathsf{r}_m^3} = \frac{|\mathsf{R}|}{\tilde{\mathsf{T}}_{00}} > 1$$

so basically whenever oscillations of R start rising, regardless of the initial value of  $\rho$  and to some extent of the specific F(R) considered.

We have shown:

• In contracting astrophysical systems with rising energy density high amplitude oscillations of curvature scalar, **R**, are induced.

- In contracting astrophysical systems with rising energy density high amplitude oscillations of curvature scalar, **R**, are induced.
- Initially harmonic, these oscillations evolve to strongly unharmonic ones with high frequency and large amplitude, which could be much larger than the value of curvature in the standard **GR**.

- In contracting astrophysical systems with rising energy density high amplitude oscillations of curvature scalar, **R**, are induced.
- Initially harmonic, these oscillations evolve to strongly unharmonic ones with high frequency and large amplitude, which could be much larger than the value of curvature in the standard **GR**.
- These spikes are damped due to gravitational particle production but the corresponding life-time could be comparable or even larger than the cosmological time.
